Fig. 7

The first part of the study focuses on the identification of the key factors influencing the success of small and medium-sized enterprises (SMEs) in the current economic environment. This involves a comprehensive review of existing literature and empirical data. The second part of the study is dedicated to the development of a framework that integrates these factors into a cohesive model. This model aims to provide a clear understanding of how different variables interact to drive business performance. The final part of the study involves the validation of the proposed framework through a series of case studies and statistical analyses. The results of these analyses are used to refine the model and provide practical recommendations for SME owners and managers. The study concludes by highlighting the importance of a holistic approach to business management and the need for continuous learning and adaptation in a dynamic market.

The diagram illustrates the conceptual framework of the study, showing the interrelationships between various variables. The central part of the diagram represents the core business performance indicators, which are influenced by a range of external and internal factors. These factors are organized into a structured grid, with arrows indicating the direction of influence. The top row of the diagram shows the primary drivers of success, which then feed into the central performance metrics. The bottom row of the diagram shows the outcomes and feedback loops that influence the overall business strategy. The diagram is a complex network of interconnected nodes and lines, representing the dynamic nature of business operations. The use of a grid structure helps to organize the information in a clear and systematic way, making it easier to understand the relationships between different components of the model. The diagram is a key element of the study, providing a visual representation of the theoretical framework that guides the research.
